

**ABSTRACT OF THE DISCLOSURE**

An alarm device is used to pickproof a lock member, and includes a mounting member, an alarm actuator, and an alarm generator. The mounting member includes a base plate formed with a through hole. The alarm actuator is mounted removably in the through hole in the base plate. The alarm generator includes an alarm circuit, and a contact member connected electrically to the alarm circuit and disposed to contact the alarm actuator when the latter is mounted in the through hole. When operated in an armed mode, the alarm circuit generates an alarm output in response to detection by the contact member of removal of the alarm actuator from the base plate.
